

X. FERMENTATIVE MICRO-ORGANISMS

Micro-organisms (bacteria and fungi) are used in bakeries, breweries, distilleries and in wine-making as well as in the production of cheeses and other dairy products. Broadly speaking, they are plants, but rather than being actually consumed by man, they are mainly used in industrial processes. Nevertheless, it is essential to consider them here because they are of enormous importance in the preparation of organic matter for human consumption.

The micro-organisms metabolize organic matter and break it down into other useful compounds. These changes in organic materials are mostly classified as fermentation and different types of fermentation may be specified according to the resulting compounds. The most important is alcoholic fermentation, in which glucose is broken down into ethyl alcohol and carbon dioxide; by this method all alcoholic beverages, and also leavened bread, are prepared. Alcoholic fermentation is carried out by yeasts and is sometimes assisted by saccharifying moulds. Another type is acetic acid fermentation, by which wine vinegar is obtained, due to the action of the bacterium *Acetobacter*; and lactic acid fermentation, whereby *Lactobacillus* spp., *Leuconostoc* spp., *Streptococcus* spp., etc. cause the souring of milk, fermentation of cabbage (sauerkraut), etc.

Micro-organisms that ferment animal or plant products for consumption not only convert carbohydrates into alcohol and carbon dioxide or into lactic acid, alcohol into acetic acid, etc., but they also add a more or less distinctive odour and taste, imparting a specific flavour to the converted material. This flavour results both from their metabolic activity and from their presence. Micro-organisms are sometimes removed from converted substances, such as wines or beers, but for sour milk or cheeses they are, on the contrary, left in the processed material and 1 cc of sour milk, for example, normally contains 500 million streptococci. In such cases some bacteria and fungi used in food processing may be classified as flavouring plants or, exceptionally, even as food plants (e.g. food yeast).

Fermentation especially for flavouring purposes is used on many vegetables, spices, beverage materials, etc. Such fermentation may be of two kinds: either the materials are fermented by their own enzymes which are liberated by breakage of the cells, as in the case of tea; or fermentation may be caused by bacteria or moulds (e.g. processing of cocoa seeds, soya beans and vanilla capsules).

Not all the micro-organisms used to improve our foods are fermentative microbes. Acetic acid fermentation is, strictly speaking, not a fermentative process at all, because it takes place not by anaerobic, but aerobic respiration. There are many food microbes which can under no circumstances be called fermentative and which in this chapter are put together with fermentative micro-organisms only for convenience. These are the bacteria and fungi that cause the ripening of cheeses (301), saccharifying micro-organisms (302) and the grey mould responsible for the excellent taste of some sweet wines (304).

ACETIC ACID FERMENTATION

299. *Acetobacter*

Acetic acid fermentation results from the aerobic respiration of some bacteria that oxidize alcohol to acetic acid and water. Acetic acid is the main organic compound in vinegar and thus every vegetable material that is able to undergo alcoholic fermentation may be further converted into vinegar. In grape-growing countries vinegar is derived from wine, in Great Britain from fermented malt and in the U.S.A. the commonest alcoholic base is cider. The name vinegar itself is of French origin and means "sour wine". The organisms causing acetic acid fermentation are bacteria belonging to the genus *Acetobacter*, and they may be divided into two groups according to their ability to break acetic acid down further into carbon dioxide and water. The species that possess this ability are *Acetobacter aceti*, *A. xylinum*, *A. pasteurianum*, *A. keutzingianum* and *A. rancens*. In contrast, the species *A. melanogenum*, *A. suboxydans*, *A. roseum* and *A. oxydans* are not capable of further metabolism of acetic acid, and have been reclassified as *Acetomonas*.

Vinegar is produced either by the quick or by the slow method of fermentation. The quick method is performed by *Acetobacter acetogenum* and by the acetic acid bacterium *Bacterium schuetzenbachii*, while those used for the slow method are *A. aceti*, *A. rancens* and *A. xylinum*.

LACTIC ACID FERMENTATION

300. *Lactobacillus*, *Leuconostoc* and *Streptococcus*

Lactic acid fermentation is used chiefly in the processing of various dairy products. It is a process in which sugar (glucose) is broken down into two molecules of lactic acid by the anaerobic respiration of various bacteria. Cultured sour milk and sour cream are produced by the inoculation of milk with *Streptococcus lactis* or *S. cremoris*; these bacteria produce the acidity

while bacteria of the genus *Leuconostoc* (*L. citrovorum* and *L. dextranicum*) are added simultaneously for flavouring purposes. Souring of milk may also be brought about by lactobacilli; e.g. *L. acidophilus* ferments milk to produce acidophilic milk, or so-called biogurt. A special *Lactobacillus* is also required for the production of yogurt; it is fermented by *L. bulgaricus* together with *Streptococcus thermophilus* in the ratio of 1:1 at a temperature of 37°C, while the ordinary souring of milk takes place at normal room temperature (20°C). When milk is inoculated with only *S. thermophilus* at 37°C, Bulgarian buttermilk is obtained. Kefir, produced from cows', goats' or sheep's milk, and koumiss, usually derived from mares' milk, require fermentation with various species of *Streptococcus*, *Lactobacillus* and *Saccharomyces* spp., lactic-fermenting yeasts. Their alcohol content is very low (0.5–1.0%).

Lactic acid fermentation is also employed in the pickling of cucumbers, cabbage (sauerkraut) and other vegetable materials; the bacteria responsible for the fermentation of pickles are mainly *Lactobacillus plantarum*, *Lactobacillus brevis* and *Leuconostoc mesenteroides*. The sour taste of rye bread is also due to lactic acid bacteria: lactic fermentation in older methods of preparing rye bread was dependent on bacteria naturally present in the dough, but in more modern methods the dough is artificially inoculated with a culture of lactic acid bacteria.

Lactobacillus lactis, *L. casei* and *L. brevis* are normally used at low temperatures, while *L. bulgaricus* and *L. thermophilus* are recommended for high temperature fermentation. But the peculiar drink *dahi*, a kind of Indian yogurt, requires a complex mixture of lactic acid microbes: apart from *Lactobacillus bulgaricus* and *L. plantarum*, some *Streptococci* and also *Lactobacillus casei* and *L. brevis* have been isolated from it.

RIPENING OF CHEESES

301. *Brevibacterium*, *Penicillium*, etc.

When cheeses are made from natural milk, it must first be soured by the addition of a starter. If the milk is being processed at higher temperatures the starter consists of *Streptococcus thermophilus* combined with a *Lactobacillus* (e.g. *L. lactis*), while if processing occurs at lower temperatures the starter is *Streptococcus lactis* or *S. cremoris*. The milk, after it reaches the required acidity, is then curdled by the addition of rennet (i.e. the enzyme rennin in impure form) which converts a soluble protein, caseinogen, into insoluble casein. In this way the sour milk is separated into curds and whey. Some cheeses are further ripened with propionic acid bacteria, e.g. *Propionibacterium shermanii*, which is responsible for the formation of "eyes" in

X. FERMENTATIVE MICRO-ORGANISMS

Emmenthaler and other cheeses. In this type of action propionic acid, acetic acid and small quantities of succinic acid and carbon dioxide are formed from glucose.

Many cheeses are ripened after they have already been shaped. This may be done by smears applied to the surface of the young rind so that the microbe then penetrates through the rind into the entire cheese. In this way the characteristic flavours of many cheeses are obtained. Limburg cheese is smeared with *Brevibacterium linens* and *B. erythrogenes*—short, reddish rod-like bacteria responsible for the taste and orange colour of the cheese. Camembert and Brie cheese are smeared with the mould *Penicillium camemberti* or *P. caseicolum*, but the blue-veined Stilton, Gorgonzola and Roquefort cheeses are produced by the addition of *Penicillium roqueforti* to the curd (see *Penicillium* (218)).

302. Saccharifying Micro-organisms

In the Far East, starters, containing some moulds as well as yeasts, are used for the fermentation of alcoholic rice beverages (sake) or some distillates such as those produced in China from *Andropogon sorghum*. These starters are called *kyoku-shi* in China and *koji* in Japan. Apart from yeasts, *kyoku-shi* contains several phycomycetes (*Rhizopus*, *Mucor* and *Absidia*, all members of the Mucorales) and several Fungi Imperfici (*Aspergillus*, *Penicillium* and *Monascus*). The Japanese sake, on the other hand, is fermented by yeast with a pure culture of *Aspergillus oryzae* forming the starter called *koji*. The function of these starters is to aid alcoholic fermentation by hydrolysing starch into sugar.

303. Grey Mould

Sometimes the alcoholic fermentation of wine is accompanied by the activity of a mould called grey mould or *Botrytis cinerea*. This is a fungus that attacks the grapevine but under certain circumstances the parasitic organism may be beneficial. Whether or not it becomes beneficial depends on the time of the attack and on the subsequent weather: if the grapes are ripe when infection takes place, *B. cinerea* will penetrate the skin by means of a greyish mycelial thread, and if dry and warm weather follows the attack the botry-

tized grape will lose some water and its sugar content will be concentrated. In addition, *B. cinerea* metabolizes sugar into glycerol instead of into alcohol, so that only a proportion of the sugar is undergoing alcoholic fermentation. It also decreases the levels of malic and tartaric acid by its metabolic processes, and all these changes help to produce excellent, sweet wines with a distinctive taste, particularly in the Sauternes and Barsac regions of France and in many other countries. In Germany the wines produced from botrytized grapes are called *Beerenauslese* and *Trockenbeerenauslese*; and the best Hungarian wine, Tokay, is fundamentally the work of *Botrytis* rather than of a special type of vine or environmental conditions. For this reason grey mould that contributes to fermentation by yeasts is called "*pourriture noble*", meaning "noble mould" or "noble decay".

Botrytized grapes cannot be left on the vine too long because they become rotten, and the infected grapes are therefore cut from the bunches before this can happen. The remaining grapes may then be successively harvested as they also become infected. However, if after the fungal attack the weather is humid and cold, *B. cinerea* can only spoil the crop.

Botrytis is a member of the Fungi Imperfetti and belongs to the order Moniliales (formerly Hyphomycetaceae).

ALCOHOLIC FERMENTATION

304. Yeast (True and False)

Alcoholic fermentation is the result of anaerobic respiration by yeast, and yeast used for the preparation of products for consumption is chiefly of the genus *Saccharomyces* (family Saccharomycetaceae; Ascomycetes). They are unicellular organisms belonging to the subgroup Protoascomycetes, while "typical" ascomycetes are multicellular organisms producing mycelia in which the diploid hyphae develop terminal asci, each with eight ascospores. In *Saccharomyces* the whole organism is considered as an ascus when four spores develop within it. Alcoholic fermentation was known from prehistoric times but yeast was first discovered in the seventeenth century and it was a further 200 years before it was recognized as the cause of alcoholic fermentation. This important fact was discovered by Louis Pasteur, the founder of bacteriology and microbiology.

Brewer's yeast used for brewing beer is either *S. cerevisiae* or *S. carlsbergensis*. The latter causes bottom fermentation, settling at the bottom of the fermented malt, while the former is responsible for top fermentation, floating clumped together at the surface. Beers, stouts and porters are brewed by top fermentation and bottom fermentation is used for lager beers: *S. carlsbergensis* is named after the famous Danish lager brewery Carlsberg.

X. FERMENTATIVE MICRO-ORGANISMS

A wild variety of *S. cerevisiae*, *S. c.* var. *ellipsoideus*, often considered as a separate species, *S. ellipsoideus*, is the yeast adhering to the epidermis of naturally fermented by a whole group of yeasts but its specific taste is contributed by the apiculate, lemon-shaped yeast, *Kloeckera spora* spp. The characteristic bouquet of cider from Normandy is due mainly to *K. apiculata*. Different types of yeast (*S. cerevisiae* var. *sake*) are also added to rice in the production of a beer in Japan and China, but in this case the mash is inoculated simultaneously with saccharifying moulds. A special yeast is also required for the fermentation of sherry. Some authors call it *Saccharomyces beticus*, while others use the name *S. fermentati*; however, there are also workers who recognize both species of sherry yeast. Lastly should be mentioned a special yeast for the production of naturally sparkling wine: for the second fermentation the yeasts mainly used are *S. bayanus*, *S. oviformis* and *S. fructum*.

Yeast is sometimes also used for the fermentation of animal products: yeasts of various kinds, together with micro-organisms, are used to cause lactic acid fermentation of milk for the production of kefir or koumiss. In this way milk is converted into a sour and mildly alcoholic beverage. Kefir is mainly produced in the Caucasus, while koumiss is a drink of the Tartars and is normally made from mare's milk.

But it must not be overlooked that yeast is also used for reasons other than to obtain alcohol. Alcoholic fermentation of dough is used for leavening bread, the required metabolic product in this case being a gas, carbon dioxide, and not alcohol which evaporates and is lost. Baker's yeast includes various types of *S. cerevisiae*.

Other useful species of yeast include *Zygosaccharomyces sojae* and *Hansenula* spp. which are used for the fermentation of soya beans in the manufacture of soy sauce. Alcoholic fermentation also takes place in the processing of cocoa seeds and is caused not only by *S. c.* var. *ellipsoideus* and *K. apiculata*, which have already been mentioned, but also by *S. anomalis* and *Schizosaccharomyces bussel*.

All the yeasts listed so far are true yeasts belonging to the Ascomycetes (subgroup Protoascomycetes), but there are also false yeasts, belonging to the Fungi Imperfetti. Among these micro-organisms is Torula yeast (*Torulopsis* or *Candida utilis*) which was manufactured in Jamaica on a large scale after the Second World War as a food yeast. Food yeast is consumed for its rich vitamin content as well as being a source of proteins which are especially valuable in the tropics. After production, food yeast is often dried and made more palatable by mixing it with chocolate or spices. Another false yeast which has industrial importance is *Brettanomyces*; species of this are used in the alcoholic after-fermentation of English beers in storage as well as in the production of some Belgian beers. Furthermore, useful false yeasts of the genus *Candida* include *C. krusei*, which is added to dairy starters to promote

the activity of lactic acid bacteria, and *C. utilis*, *C. lipolytica* and *C. tropicalis* which are often used for the production of food yeast.

299. YEAST (*Saccharomyces* spp.)
Budding yeast (highly magnified)

The chemical constitution of yeasts per 100 g (or per 100 mg in the case of vitamins) is as follows:

Type of yeast	Water	Pro-	Fats	Carbo-	Vitamins				
					A	Thia-	Ribo-	Niacin	Ascorbic
	%	%	%	%		mine	flavin		acid
Baker's yeast (dry)	5	36.9	1.6	38.9	trace	2.33	5.41	36.7	trace
Brewer's yeast (dry)	5	38.8	1.0	38.4	trace	15.61	4.28	37.9	trace
Formula yeast (dry)	6	38.6	1.0	37.6	trace	14.01	5.06	44.4	trace

- 301. Fungi causing the ripening of cheeses
- Penicillium camemberti* or *caseicolum*
- P. expansum*
- P. roqueforti*

APPENDICES

MORPHOLOGICAL SURVEY

OF THE COMMONEST PLANTS CONSUMED BY MAN

The plants consumed by man belong, as do all other plants, to various taxonomic groups but only the largest and most fundamental are mentioned here. The plant kingdom is primarily divided into Bacteria (Bacteriophyta), Cyanophyta, Algae (Phycophyta), Fungi (Mycophyta), Pteridophyta and Spermatophyta (consisting of Gymnospermae and Angiospermae).

The second fundamental division of plants consumed by man concerns their specific structure, by which they may be arranged into appropriate morphological groups. Taking as an example the carrot, it is an angiospermous plant used for its thickened, swollen primary root and for this reason it belongs to a special morphological group, together with other angiosperms that develop taproot such as chicory, parsnip, salsify etc. There are many such morphological groups, occurring mainly among the angiosperms, and it is therefore useful to present them in the form of a list:

- Thallophyta
 - Bacteria (Bacteriophyta)
 - Cyanophyta
 - Algae (Phycophyta)
 - Leaf-like or stem-like thallus
 - "Midrib"
 - "Sporophyll"
 - Stipe
 - Mucilage
 - Fungi (Mycophyta)
 - Entire thallus
 - Fungal macrofructification
 - Algae and Fungi (Lichens)
- Cormophyta
 - Pteridophyta
 - Developing fronds
 - Gymnospermae
 - Stem
 - Rhizome

Wood	
Seed	
Cupule of the seed	
Resin	
Angiospermae	
Root	
Swollen taproot	Dry
Fleshy adventitious root	(a) Achenial
Root tuber	Achene
Bark of the root	Caryopsis
Stem	Nut
Stem	(b) Capsular
Swollen hypocotyl	Capsule
Swollen hypocotyl with the swollen taproot and epicotyl	Legume
Hypocotyl with the cotyledons	Follicle
Swollen epicotyl	(c) Schizocarpic
Stem sprout	Lomentum
Stem tuber	Cremocarp
Stolon	Mericarp
Rhizome	Carcerulus
Corm	Fleshy
Pith	Berry
Bark of the stem	Hesperidium
Wood	Hesperidium-like
Leaf	Pepo
Whole leaf	Pome
Midrib	Drupe
Swollen base of the leaf	Accessory fleshy fruit
Petiole	II. Aggregate
Swollen base of the petiole	Dry
Main bud	Etaerio of achenes
Axillary bud	Etaerio of follicles
Bulb	Fleshy
Leafy shoot	Etaerio of berries
Leaves and flowering tops (or flowering shoots)	Etaerio of drupes
Flower	III. Multiple (Compound)
Flower (single) or inflorescence	Dry
Calyx	Strobilus
Stigma and the tip of the style	Fleshy
Flower bud	Sorosis
Swollen inflorescence	Syconium
Fruit	Seed
I. Simple	Seed of an achene

Seed of a legume
Seed of a capsule
Seed of a lomentum
Seed of a siliqua
Seed of a berry
Seed of a drupe

Seed of a pepo
Seed with a seedling
Embryo of an albuminous seed
Aril
Sap
Latex
Resin
Gum
Nectar

The plants are listed under each morphological group in alphabetical order according to their common name. The common name is preceded by a number from 1 to 304 indicating the location of the particular plant in the present book. Numbers in brackets mean that the numbered item reappears in another chapter or chapters (e.g. under the number 263 there is a description of the poppy plant as a flavouring (poppy seed), while the bracketed number [263] introduces the poppy plant as a source of opium developed from the latex and the description occurs in the chapter on masticatories and fumitories). Repeated numbers without brackets refer to the same section which discusses or at least mentions more than one plant. For example, under number 219 there is a discussion of the truffle as well as other underground mushrooms: *Terfaria*, *Tirmania* and *Choicomycetes*. Thus, in this survey the same number is used four times. Sometimes, but exceptionally, a plant appears under more than one number; this happens when the same plant is mentioned in two or more sections for some unavoidable technical reason (see *Penicillium*, numbers 218, 301 and 302). Lastly, plants without numbers but marked with an asterisk occur in the text independently of the numbered items. They are classified morphologically only in this survey.

The common name is followed by the scientific name and by the name of the family to which the plant belongs. This rule is broken only in the case of bacteria and microscopic fungi owing to basic differences in their classification. Plants other than dicotyledons are also accompanied by the name of a higher botanical group than the family; this name appears after the family in parentheses (most of the plants discussed belong to the dicotyledons, in which case the name is omitted to avoid unnecessary repetition).

The botanical classification of plants consumed by man is followed by their mode of use, expressed as the following abbreviations:

ALC	Alcoholic beverages
ALK	Alkaloidal beverages
CER	Cereals
COFSUB	Coffee substitutes
DYE	Food dye plants

FER	Fermentative micro-organisms
FLA	Flavourings
FRU	Fruits
FUM	Fumitories
GUM	Gum plants
MAST	Masticatories
NUT	Nuts
OIL	Oil plants
PCER	Pseudo-cereals
SMO	Plants used for smoking food
STA	Starch plants
SUG	Sugar plants
TESUB	Tea substitutes
VEG	Vegetables
VIN	Vinegar

Capsicum or Red pepper, Paprika etc. or *Capsicum annuum*, Solanaceae (VEG)[66.] Capsicum or Red pepper (*Capsicum annuum*) and Cayenne pepper (*Capsicum frutescens*) Solanaceae (FLA)128. Carambola or *Averrhoa carambola*, Oxalidaceae (FRU)

Other species:

*A. bilimbi*131. Ceriman (Monstera plant) or *Monstera deliciosa*, Araceae (Monocotyledoneae) (FRU)

Fruit—Simple (contd.)**FLESHY (contd.)****Baccate fruit (Berry) (contd.)**134. Cranberry or *Vaccinium*

spp., Ericaceae

(FRU)

American

species:

*V. macrocarpus**V. vitis-idaea* var.*minus*

European variety

V. vitis-idaea var.*vitis-idaea*

Cranberry from

northern hemisphere

V. oxycoccus

(Mossberry)

135. Currant or *Ribes* spp.,

Saxifragaceae (FRU)

Ribes sativum

(Red currant)

Ribes niger (Black currant)137. Date palm or *Phoenix**dactylifera*, Palmae-ceae (Monocoty-
ledoneae) (FRU)282. Date or *Phoenix dac-**tylifera*, Palmaceae

(Monocotyledoneae)

(COFSUB)

82. Elder or *Sambucus**niger*, Sambucaceae

(FLA)

81. Egg-plant (Aubergine)

or *Solanum melano-**gena*, Solanaceae

(VEG)

216. Elder or *Sambucus**niger*, Sambucaceae

(DYE)

Fruit—Simple (contd.)**FLESHY (contd.)****Baccate fruit (Berry) (contd.)**140. Gooseberry or *Grossu-**laria reclinata* (*Ribes**uva-crispa*), Saxifra-

gaceae (FRU)

American species:

*R. hirtellum**R. missouriense*141. Grape or *Vitis* spp.,

Vitaceae (FRU, ALC)

[141.] Grape or *Vitis* spp.,

Vitaceae (ALC, VIN)

143. Guava or *Psidium**guajava*, Myrtaceae

(FRU)

Cultivars:

*P. g. var. pomifera**P. g. var. pyrifera**P. g. var. cattle-**ianum* or*littorale*152. Mangosteen or *Gar-**cinia mangostana*,

Guttiferae (FRU)

158. Papaya (Pawpaw) or

Carica papaya,

Caricaceae (FRU)

158. Papaya (Pawpaw) or

Carica papaya,

Carycaceae, unripe

(VEG)

159. Passion fruit or *Passi-**flora edulis*, Passi-

floraceae (FRU,

FLA).

Edible parts are

mainly the arils

Another important

species:

*P. quadrangularis***Fruit—Simple (contd.)****FLESHY (contd.)****Baccate fruit (Berry) (contd.)**

162. Persimmon, Japanese or

Diospyros kaki,

Ebenaceae (FRU)

D. lotus (Date

plum)

*D. virginiana*124. Plantain or *Musa**paradisiaca* var. *para-**disiaca*, Musaceae

(Monocotyledoneae)

(VEG)

165. Pomegranate or *Punica**granatum*, Punicaceae

(FRU)

141. Raisin or *Vitis* spp.,

Vitaceae (FLA)

170. Sapotilla (Chiku) or

Manilkara achras(syn. *M. zapotilla* or*Zapota achras*),

Sapotaceae (FRU)

115. Tomato or *Lycopersi-**cum esculentum* (or*Solanum lycopersi-**cum*), Solanaceae

(VEG)

Varieties:

*L. e. var. cerasiforme**L. e. var. communis**L. e. var. grandifoliun**L. e. var. pyriforme**L. e. var. validum***Hesperidium**157. Bergamot or *Citrus**aurantium* var.*bergamia*, Rutaceae

(FLA)

Fruit—Simple (contd.)**FLESHY (contd.)****Hesperidium (contd.)**240. Citron or *Citrus medica*var. *bajura*, Rutaceae

(FLA)

142. Grapefruit or *Citrus**paradisi* or *maxima*,

Rutaceae (FRU)

145. Kumquat or *Fortu-**nella* spp., Rutaceae

(FRU)

252. Lemon or *Citrus**medica* var. *limonum*,

Rutaceae (FLA)

253. Lime or *Citrus auran-**tifolia*, Rutaceae

(FLA)

150. Mandarin, Tangerine,

etc. or *Citrus nobilis*or *reticulata*, Ruta-

ceae (FRU)

157. Orange or *Citrus**aurantium*, Rutaceae

(FRU, FLA)

Varieties:

C. a. var. sinensis

(sweet orange)

C. a. var. amara

(bitter orange)

C. a. var. bergamia

142. Shaddock (Pummelo,

Pomelo) or *Citrus**grandis*, Rutaceae

(FRU)—a cross

between *C. grandis*and *C. sinensis*

150. Ugli or a cross between

Citrus reticulata and*C. paradisi* (FRU)

Fruit—Simple (contd.)**FLESHY (contd.)****Hesperidium-like berry**

123. Bael (Bengal quince) or
Aegle marmelos,
Rutaceae (FRU)

Pepo

74. Chayote or *Sechium edule*, Cucurbitaceae (VEG)

79. Cucumber or *Cucumis sativa*, Cucurbitaceae (VEG)

154. Melon or *Cucumis melo*, Cucurbitaceae (FRU)

104. Pumpkin and squash (vegetable marrow) or *Cucurbita* spp., Cucurbitaceae (VEG)

Species and varieties:*C. ficifolia**C. maxima* var.
*maxima**C. maxima* var.
*turbaniformis**C. mixta**C. moschata**C. pepo* var.
*medullosa**C. pepo* var.
*melopepo**C. pepo* var. *pepo*

172. Watermelon or *Cold- cynthus citrullus*, Cucurbitaceae (FRU)

Pome

121. Apple or *Malus pumila*, Rosaceae (FRU)
M. p. var. *mitis*
M. p. var. *sylvestris*

PLANTS CONSUMED BY MAN**Fruit—Simple (contd.)****FLESHY (contd.)****Pome (contd.)**

- [121.] Apple or *Malus pumila*, Rosaceae (ALC)

- [121.] Apple or *Malus pumila*, Rosaceae (GUM)

148. Loquat or *Eriobotrya japonica*, Rosaceae (FRU)

153. Medlar or *Mespilus germanica*, Rosaceae (FRU)

161. Pear or *Pyrus communis*, Rosaceae (FRU)

166. Quince or *Cydonia oblonga*, Rosaceae (FRU)

Varieties:*C. o.* var. *luxitana**C. o.* var. *malfornmis**C. o.* var. *moratana**C. o.* var. *pyriformis**C. o.* var. *pyramidalis***Drupe**

122. Apricot or *Prunus armeniaca*, Rosaceae (FRU)

- [122.] Apricot or *Prunus armeniaca*, Rosaceae (ALC)

216. Apricot or *Prunus armeniaca*, Rosaceae (DYE)

MORPHOLOGICAL SURVEY**Fruit—Simple (contd.)****FLESHY (contd.)****Drupe (contd.)**

125. Barbados cherry (*Acerola* or West Indian Cherry) or *Malpighia glabra*, Malpighiaceae (FRU)

236. Cassia bud or *Cinnamomum cassia*, Lauraceae (FLA)— Only unripe drupe consumed

132. Cherry, Sour (Morello cherry) or *Prunus cerasus*, Rosaceae (FRU)

- [132.] Cherry, Sour or *Prunus cerasus*, Rosaceae (ALC)

133. Cherry, Sweet or *Prunus avium*, Rosaceae (FRU)

144. Huckleberry or *Gaylussacia baccata*, Ericaceae (FRU)

149. Mamey (Mammey apple) or *Mammea americana*, Guttiferae (FRU)

151. Mango or *Mangifera indica*, Anacardiaceae (FRU)

156. Nectarine or *Prunus persica* var. *nectarina*, Rosaceae (FRU)

Fruit—Simple (contd.)**FLESHY (contd.)****Drupe (contd.)**

194. Oil palm or *Elaeis guineensis*, Palmaeae (Monocotyledoneae) (OIL)

- Groups of oil palms:
Dura
Macrocarpa

Pisifera
Tenera

93. Olive or *Olea europaea*, Oleraceae (VEG, FLA)

- [93.] Olive or *Olea europaea*, Oleraceae (OIL)
160. Peach or *Prunus persica*, Rosaceae (FRU)

- [160.] Peach or *Prunus persica*, Rosaceae (ALC, FLA)

261. Pepper or *Piper nigrum*, Piperaceae (FLA)— Immature drupe used only

164. Plum and Prune or *Prunus* spp., Rosaceae (FRU)

- [164.] Plum or *Prunus* spp., Rosaceae (ALC)

Types of plum:
P. cerasifera (myrobalan, greengage)

P. domestica (Victoria plum)

P. domestica var. *economica* (Zwetschken)

P. insititia (mirabelle, damson)

Fruit—Simple (contd.)

FLESHY (contd.)

Drupe (contd.)

271. Sumac or *Rhus coriaria*,
Anacardiaceae
(FLA)

241. *Syzygium aromaticum*
— new term for clove
(*Eugenia caryophyllata*)

91. *Ziziphus lotus* and *Z. jujuba*, Rhamnaceae (FRU, PCER, ALC)

Accessory fleshy fruit

130. Cashew apple or *Anacardium occidentale*, Anacardiaceae (FRU)

169. Rose Hip or *Rosa* spp., Rosaceae (FRU)
Species of roseships:

- R. acicularia*
R. arvensis
R. canina
R. laxa
R. rugosa
R. villosa or *mollis*
R. v. var. pomifera

171. Strawberry or *Fragaria* spp., Rosaceae (FRU)

- F. moschata*
F. vesca
F. vesca var. *semperflorens*

- American species:
F. chiloensis
F. virginiana

Infructescence

244. Dill or *Anethum graveolens*, Umbelliferae (FLA)

PLANTS CONSUMED BY MAN**Fruit—Aggregate**

DRY

Etaerio of follicles

225. Anise, Star or *Illicium verum*; see Follicle

FLESHY

Etaerio of berries

136. Custard apple or *Annona* spp., Annonaceae (FRU)
A. reticulata
(Sweetsop or Sugar apple)
A. squamosa or Bullock's head, etc.

Etaerio of drupelets

127. Blackberry or *Rubus fructicosus*, Rosaceae (FRU)

- American species cultivated
R. allegheniensis
R. argutum
R. frondosus

147. Loganberry or *Rubus loganobaccus*, Rosaceae (FRU)

168. Raspberry or *Rubus idaeus*, Rosaceae (FRU)

- American species:
R. occidentale
(black)
R. strigosus (red)

Fruit—Multiple (Compound)

DRY

Strobilus

250. Hop or *Humulus* spp., Moraceae (FLA)

MORPHOLOGICAL SURVEY**Fruit—****Multiple (Compound)**

FLESHY

Sorosis

61. Breadfruit or *Artocarpus altilis*, Moraceae (VEG)

85. Jack-fruit or *Artocarpus heterophyllus*, Moraceae, immature (VEG), mature (FRU)

155. Mulberry or *Morus alba* (White mulberry) and *nigra* (Black mulberry), Moraceae (FRU)

163. Pineapple or *Ananas comososa*, Bromeliaceae (Monocotyledoneae) (FRU)

Syconium

139. Fig or *Ficus carica*, Moraceae (FRU)

Infructescence

244. Dill or *Anethum graveolens*, Umbelliferae (FLA)

Seed**Seed of an achene**

14. Buckwheat or *Fagopyrum sagittatum*, Polygonaceae (PCER)

193. Niger seed or *Guizotia abyssinica*, Compositae (OIL)

Seed (contd.)**Seed of an achene (contd.)**

16. Quinoa or *Chenopodium quinoa*, Chenopodiaceae (PCER, VEG)
Other species:
C. nuttalliae
C. album

- [16.] Quinoa or *Chenopodium quinoa* etc. (ALC)

197. Safflower or *Carthamus tinctorius*, Compositae (OIL)

187. Sunflower or *Helianthus annuus*, Compositae (NUT, OIL)

- [187.] Sunflower or *Helianthus annuus*, Compositae (OIL)

Seed of a caryopsis

1. Barley or *Hordeum vulgare* var. *distichum* and *hexastichum*, Gramineae, tribe Triticeae (Monocotyledoneae) (CER)

2. Maize or *Zea mays*, Gramineae, tribe Maydeae (Monocotyledoneae) (CER)
Varieties:

- Z. m. var. americana*

- Z. m. var. amylacea*

- Z. m. var. everta*

- Z. m. var. saccharata*

- Z. m. var. praecox*

- Z. m. var. tunnicata*

Seed (contd.)**Seed of a caryopsis (contd.)**

3. Millet, Finger (Bird's foot millet, korakan, marua, telabun) or *Eleusine corocana*, Gramineae, tribe Chlorideae (Monocotyledoneae) (CER)
4. Millet, Foxtail or *Setaria italica*, Gramineae, tribe Paniceae (Monocotyledoneae) (CER)
5. Millet, Japanese barnyard (Sanwa millet) or *Echinochloa crus-galli* var. *frumentacea*, Gramineae, tribe Paniceae (Monocotyledoneae) (CER)
6. Millet, Pearl (Bulrush millet) or *Pennisetum glaucum* (*P. typhoideum*), Gramineae, tribe Paniceae (Monocotyledoneae) (CER)
7. Millet, Proso or *Panicum miliaceum*, Gramineae, tribe Paniceae (Monocotyledoneae) (CER)
8. Oat or *Avena* spp., Gramineae, tribe Aveneae (Monocotyledoneae) (CER)
 - A. byzantina*
 - A. fatua*
 - A. nuda*
 - A. orientalis*
 - A. sativa*

PLANTS CONSUMED BY MAN**Seed (contd.)**

9. Rice or *Oryza* spp., Gramineae, tribe Oryzeae (Monocotyledoneae) (CER, ALC)
10. Rye or *Secale cereale*, Gramineae, tribe Triticeae (Monocotyledoneae) (CER)
11. Sorghum or *Sorghum vulgare*, Gramineae, tribe Andropogoneae (Monocotyledoneae) (CER)
 - Cultivated varieties:
 - S. v.* var. *caffrorum*
 - S. v.* var. *caudatum*
 - S. v.* var. *durra*
 - S. v.* var. *hegari*
 - S. v.* var. *nervosum*
 - S. v.* var. *rexburgii*
12. Wheat or *Triticum* spp., Gramineae, tribe Triticeae (Monocotyledoneae) (CER)
 - Einkorn group:
 - T. monococcum*
 - Tetraploid group or emmer wheat:
 - T. durum*
 - T. persicum*
 - T. polonicum*
 - T. turgidum*
 - Hexaploid or vulgate group:
 - T. compactum*
 - T. macha*
 - T. spelta*
 - T. sphaerococcum*
 - T. villosa*
 - T. vulgare* or *aestivum*

MORPHOLOGICAL SURVEY**Seed (contd.)****Seed of a nut**

174. Acorn or *Quercus* spp., Fagaceae (PCER, NUT)
 - Edible species:
 - Holm oak or *Quercus ilex*
282. Acorn, etc. (COFSUB)
176. Beechmast or *Fagus* spp., Fagaceae (PCER, NUT)
282. Beechmast, etc. (COFSUB)
178. Chestnut, Sweet or *Castanea sativa*, Fagaceae (PCER, NUT)
 - American species:
 - C. dentata*
 - C. pumila*
 - Chinese spp.
 - C. mollissima*
 - Japanese spp.
 - C. crenata*
180. Hazel nut or *Corylus* spp., Betulaceae (NUT)
 - European spp.:
 - C. avellana*
 - C. maxima*
 - Turkish spp.:
 - C. colurna*
 - N. American spp.:
 - C. americana*
 - C. rostrata*
146. Litchi or *Nephelium litchi*, Sapindaceae (FRU)
167. Rambutan or *Nephelium lappaceum* (FRU)

Seed (contd.)**Seed of a nut (contd.)**

17. Water chestnut or *Trapa natans* (Cal-trop), Onagraceae (PCER)
 - Other spp. of the Far East:
 - T. bicornuta* (Bull's head)
 - and of tropical Asia:
 - T. hispинosa* (Singhara nut)
120. Akee or *Blighia sapida*, Sapindaceae (FRU)
216. Annatto or *Bixa orellana*, Bixaceae (FRU)
13. Amaranth or *Amaranthus* spp., Chenopodiaceae (PCER)
294. Betel nut or *Areca catechu*, Palmaeae (Monocotyledoneae) (MAST)
177. Brazil nut or *Bertholletia excelsa*, Lecithidaceae (NUT, OIL)
235. Cardamom or *Elettaria cardamomum*, Zingiberaceae, Monocotyledoneae (FLA)
192. Cotton or *Gossypium* spp., Malvaceae (OIL, GUM)
138. Durian or *Durio zibethicus*, Bombacaceae (FRU)

Seed (contd.)**Seed of a capsule (contd.)**

249. Grain of Paradise or
Aframomum melegueta, Zingiberaceae
(Monocotyledoneae)
(FLA)

284. Guarana or *Paullinia cupana*, Sapindaceae
(ALK)

178. Horse chestnut or
Aesculus hippocastanum, Hippocastanaceae (NUT)
Edible species:

A. californica
A. octandra
A. turbinata

263. Poppy or *Papaver somniferum*, Papaveraceae (FUM, OIL, FLA)

[263.] Poppy or *Papaver somniferum*, Papaveraceae (FUM)

198. Sesame or *Sesamum indicum* or *orientale*, Pedaliaceae (OIL)

[198.] Sesame or *Sesamum indicum*, Pedaliaceae (FLA)

Seed of a legume (ripe or unripe)

44. Bambara groundnut or
Voandzeia subterranea, Leguminosae (VEG)

46. Bean, Adzuki or
Phaseolus angularis, Leguminosae (VEG)

47. Bean, Black gram or
Phaseolus mungo, Leguminosae (VEG)

PLANTS CONSUMED BY MAN**Seed (contd.)**

Seed of a legume (ripe or unripe)
(contd.)

48. Bean, Broad or *Vicia faba*, Leguminosae (VEG)

49. Bean, French or
Phaseolus vulgaris, Leguminosae (VEG)

50. Bean, Goa (Asparagus bean) or *Psophocarpus tetragonolobus*, Leguminosae (VEG)

51. Bean: Horsegram or
Dolichos uniflorus (syn. *D. biflorus*), Leguminosae (VEG)

52. Bean, Lablab or *Dolichos lablab* or *niger*, Leguminosae (VEG)

53. Bean, Lima (Sieve bean or Butter bean) or *Phaseolus lunatus*.
Phaseolus lunatus var. *macrocarpus* = *P. limensis*, Leguminosae (VEG)

54. Bean, Moth (Mat bean) or *Phaseolus acutifolius*, Leguminosae (VEG)

55. Bean: Mung (Green and Gold gram) or *Phaseolus aureus* (syn. *Vigna aureus*), Leguminosae (VEG)

56. Bean, Scarlet Runner or
Phaseolus coccineus or *multiflorus*, Leguminosae (VEG)

MORPHOLOGICAL SURVEY**Seed (contd.)**

Seed of a legume (ripe or unripe)
(contd.)

57. Bean, Soya or *Glycine max* or *G. soja* or *Soja hispida*, Leguminosae (VEG)

[57.] Bean, Soya or *Glycine max*, etc. (OIL)

58. Bean, Tepary or
Phaseolus acutifolius var. *latifolius*, Leguminosae (VEG)

282. Carob (syn. St. John's bread, Locust) or
Ceratonia siliqua, Leguminosae (COPSUB)

245. Fenugreek or *Trigonella foenum-graecum*, Leguminosae (FLA)

44. Kerstling's groundnut or *Kerstlingiella geocarpa*, Leguminosae (VEG)

89. Lentil or *Lens culinaris*, Leguminosae (VEG)

97. Pea (Field and Garden pea) or *Pisum sativum* var. *arvense* and *hortense*, Leguminosae (VEG)

282. Pea (Field and Garden pea) or *Pisum sativum* (COPSUB)

98. Pea, Chick or *Cicer arietinum*, Leguminosae (VEG)

282. Pea, Chickpea or *Cicer arietinum* etc. (COPSUB)

Seed (contd.)

Seed of a legume (ripe or unripe) (contd.)

99. Pea, Cow- or *Vigna spp.*, Leguminosae (VEG)

V. unguiculata
V. sinensis
V. sesquipedalis

100. Pea, Grass (Chickling Pea) or *Lathyrus sativus*, Leguminosae (VEG)

101. Pea, Pigeon or *Cajanus cajan*, Leguminosae (VEG)

183. Peanut or *Arachis hypogaea*, Leguminosae (NUT)

[183.] Peanut or *Arachis hypogaea*, Leguminosae (OIL)

Seed of a follicle

283. Cola or *Cola nitida*, Sterculiaceae (MAST)

Seed of a siliqua

196. Field mustard or
Brassica campestris var. *sarson* and var. *toria*, Cruciferae (OIL)

196. Indian mustard or
Brassica juncea, Cruciferae (OIL)

259. Mustard or *Brassica nigra* and *alba* (syn. *Sinapis alba* or *hirta*), Cruciferae (FLA)

196. Rape or *Brassica napus*, Cruciferae (OIL)

Seed (contd.)

Seed of a carcerulus

15. Chia or *Salvia columbariae*, Labiateae
(PCER)

Seed of a lomentum

272. Tamarind or *Tamarindus indica*, Leguminosae
(NUT)

Seed of a berry

191. Cocoa or *Theobroma cacao*, Sterculiaceae
(OIL)
256. Mace, or aril of *Myristica fragrans*, Myristicaceae (FLA)

152. Mangosteen or *Garcinia mangostana*, Guttiferae (FRU)

- * *Madhuca* spp., Dipterocarpaceae (OIL)

Oil yielding species

- M. butyracea*
M. latifolia
M. longifolia
M. molliegiana

199. Shea Butter or *Butyrospermum paradoxum*, Sapotaceae (OIL)

- [256.] Nutmeg—the seed of *Myristica fragrans*, Myristicaceae (FLA)

Seed of a pepo

182. Oyster nut or *Telfairia pedata*, Cucurbitaceae (NUT)

Seed of a drupe

175. Almond or *Prunus amygdalus*, Rosaceae
(NUT)

PLANTS CONSUMED BY MAN**Seed (contd.)**

Seed of a drupe (contd.)

229. Bean, Tonka or *Dipteryx odorata*, Leguminosae (FLA)
179. Coconut or *Cocos nucifera*, Palmaceae (Monocotyledoneae) (NUT)
281. Coffee or *Coffea arabica* etc., Rubiaceae (ALK)
185. Java almond or *Canarium commune*, Burseraceae (NUT)
181. Macadamia nut (Queensland nut) or *Macadamia* spp., Proteaceae (NUT)

Other species:

- M. ternifolia* var. *integerrifolia* (thin-shelled)
M. tetraphylla (exalbuminous seed)

194. Oil palm or *Elaeis guineensis* (Monocotyledoneae) (OIL)

195. Palm oil of Brazil, Palmaceae (Monocotyledoneae) (OIL)

- Astrocaryum murumuru* (Muru-muru palm)
Orbygnya cohune (Cohune palm)

- Orbygnya martiana* or *olifera* (Babassu palm)

Syagrus coronata (Lucuri palm)

MORPHOLOGICAL SURVEY**Seed (contd.)**

(Lower plants with bodies (thalli) not differentiated into organs)

ALGAE

1. **Hapteron** (pl. *haptera*): root-like device for anchorage of the alga.

2. **Holdfast:** device for anchorage, either root-like (haptera) or disc-like.

3. **Lamina, Untrue:** a blade-like structure formed by the thallus.

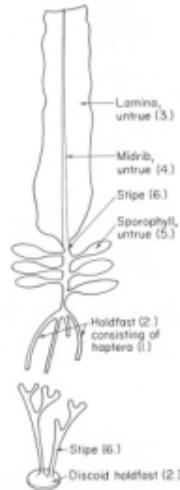

4. **Midrib, Untrue:** median thickening of the blade-like structure of the thallus, similar to the proper midrib of a true leaf.

5. **Sporophyll, Untrue:** special lamina-like structure bearing sporangia (structures containing spores).

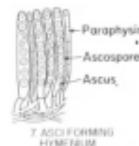

6. **Stipe:** a structure of the thallus similar to the petiole (leaf stalk) of a true leaf.

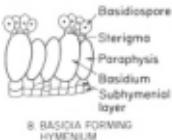

FUNGI

7. **Ascus:** a characteristic spore-producing cell of the Ascomycetes. It is spherical, club-shaped or cylindrical and produces eight ascospores by three successive cell divisions, two of these being meiotic, leading to the production of cells having half the number of chromosomes of the parent cells and the third mitotic, leading to cells having the same number of chromosomes as the parent cells.

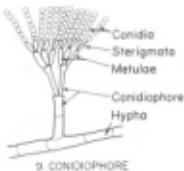

ALGAE (1-6)

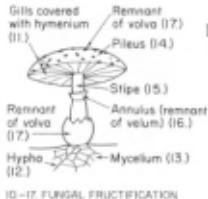

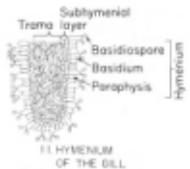

- 8. Basidium:** a characteristic spore-producing cell of the Basidiomycetes. The spores develop inside the cell and then migrate into outgrowths of the cell called sterigmata, with which they are abstricted by a process of budding. The characteristic number of basidiospores is four.

- 9. Conidiophore:** a spore-producing branch (hypha) of the mycelium (vegetative part of the fungal thallus consisting of network of hyphae). The conidia (spores) are abstricted from the tip of the conidiophore. In cases where the conidiophores are branched, the conidia are borne on the ultimate stalks called sterigmata which arise from branched metulae. The conidia are mostly not immediately abstricted, but appear in chains at the tip of the conidiophore.

- 10. Fungal Fructification:** a spore-producing structure emerging above the substrate in which the fungus is growing, e.g., mushroom and toadstool. A typical fungal fructification consists of a cap (pileus) and a stem (stipe). Sometimes the entire fructification is enclosed by a universal veil (volva) in addition to a velum, a partial veil, enclosing the young gills in the annular cavity.

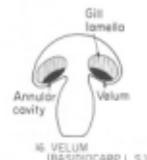

- 11. Hymenium:** the superficial layer containing the ascospores or basidiospores, as well as sterile cells called paraphyses. It includes the lining of the apothecia, the cup-shaped fruiting bodies of the Ascomycetes, and the gills or tubules opening to the exterior on the lower surface of the Basidiomycetes.

- 12. Hyphae:** thread-like whitish filaments constituting the body of the fungus (see *Mycelium*).
13. Mycelium: the vegetative fungal body, consisting of hyphae.

- 14. Pileus:** the name given to the cap of the Agaricales. The gills or tubules on the lower surface bear basidiospores. The pileus is inserted into a stem (see *Fungal Fructification*).
- 15. Stipe:** the stem or pillar-like part of the umbrella-shaped fructification (see *Fungal Fructification*).
- 16. Velum:** a membrane stretching from the pileus to the stipe. The young gills are enclosed in the annular cavity so formed. Later the pileus expands and the velum is broken. Its remnants are left in the form of the annulus, a ring-like structure on the stipe near the cap (see also *Fungal Fructification*).
- 17. Volva:** a universal veil possessed by some gill fungi in addition to the velum. It envelops both the pileus and the stipe, but ruptures when the stipe elongates, leaving a single large piece attached to the base of the stipe and eventually small pieces on the cap (see also *Fungal Fructification*).

METAPHYTA

(True plants with the body differentiated into organs)

PTERIDOPHYTA

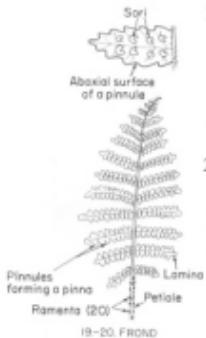

(Earliest plants having conductive tissue differentiated into xylem and phloem, i.e. the lowest Tracheophyta. This group consists mainly of club mosses, horse-tails and ferns.)

Ferns (Filicinae)

- 18. Fiddlehead Ferns:** have young leaves in which the rachis (main axis) is coiled so that it resembles the head of a violin.

PLANTS CONSUMED BY MAN

- 19. Frond:** the most prominent part of the fern, i.e. the leaf is called a frond. It consists of a stalk (petiole) and a blade (lamina). The frond is normally a sporophyll bearing spore-filled sporangia in groups (sori) on the underneath surface.
- 20. Ramenta:** chaff-like brown scales (*sing. ramentum*) consisting of a plate of cells developed from the epidermis. The ramenta cover the young leaves and the bases of old leaves.

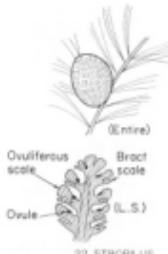

GYMNOSPERMAE

(Plants with naked seeds)

21. CUPULE (ARIL)

- 21. Cupule (Aril):** a fleshy covering of the seed e.g. in juniper, where it develops from the uppermost three scales of the cone.

- 22. Strobilus:** the reproductive structure of the conifers, commonly called a cone. In the ovulate strobilus of the pine, a central axis bears bracts or bract scales; ovuliferous scales are developed in the axils of the bract scales. The ovuliferous scales each bear two naked seeds, each with a large wing. These wings develop from the superficial layer of the ovuliferous scale and when the seed is to be freed for dispersal it splits off from the scale, together with the wing.

GLOSSARY

ANGIOSPERMÆ

(Plants bearing seeds in a closed cavity called a seedbox)

- 23. Abaxial (or Dorsal):** refers to the side of a leaf facing away from the stem, i.e. to the underneath surface (see *Adaxial*).

- 24. Achene:** a dry, indehiscent (not opening), one-seeded fruit, in which the pericarp (the matured seed-box wall) is separated from the testa (seed-coat).

- **Adaxial:** refers to the side of a leaf turned towards the stem, normally the upper surface (see *Abaxial*).

- **Androecium:** male organs of the flower, i.e. the collective name for all the statements in a flower (see *Stamen*).

- **Anther:** see *Stamen*.

- 25. Aril:** the additional investment (covering) of the seed, overlaying the testa and developing from the funicle or micropyle.

The term aril is also incorrectly used in angiosperms for the *cupule*. This is a structure formed outside the fruit, and not outside the seed like the aril. A typical example is the saucer-like structure partly surrounding the acorn, the fruit of the oak.

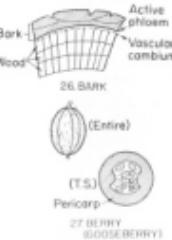

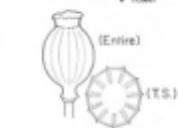

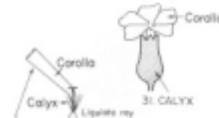

- 26. Bark:** a non-technical term used in various ways, but it normally refers to all the tissue outside the vascular cambium.

- 27. Berry:** a simple fleshy fruit enclosing the seeds, or exceptionally enclosing a single seed. The pericarp comprises the epicarp which forms the skin and the mesocarp and endocarp together, which develop into the flesh, e.g. the grape.

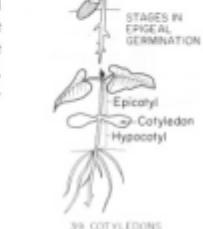

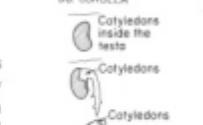

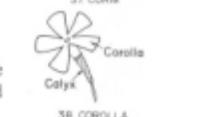

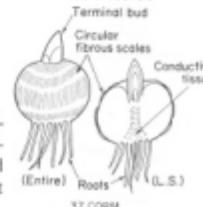

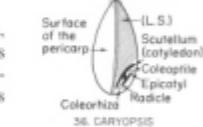

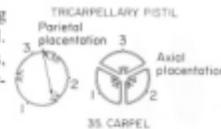

26. BARK

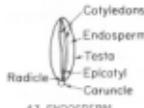

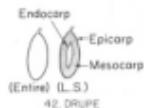

28. **Bud:** an immature shoot of a shortened stem on which overlapping, underdeveloped leaves are crowded together. The bud at the tip of the stem is the terminal bud, whilst those developing in the axils of leaves are called axillary buds. Accessory buds are additional buds in the axils of leaves and adventitious buds are those which occur elsewhere than at the tip of the stem or in the leaf axils. Some buds develop into leafy shoots, some produce flowers, while mixed buds produce both flowers and leaves.
29. **Bulb:** a shortened underground shoot or bud, covered with dry scale leaves which may be either small and overlapping (scaly bulbs) or large, reaching from the base of the bulb to its apex (tunicate bulbs).
30. **Bulbils:** small bulbs which may form instead of flowers or axillary buds.
31. **Calyx:** outermost part of the flower, consisting of sepals; usually green, leaf-like structures.
32. **Capitulum:** a racemose inflorescence in which all the flowers are crowded together on the disc representing the reduced main axis, e.g. globe artichoke and sunflower.
33. **Capsule:** a syncarpous, dry, dehiscent fruit, normally with many seeds. A good example is the capsule of the poppy plant.
34. **Carcerulus:** is a schizocarpic fruit developing from a superior ovary of two carpels with axially placed placentae and found in the Labiateae and Boraginaceae. When ripe, the fruit splits into four mericarps, each containing one seed. The split is facilitated by the presence of a false septum in each loculus. In certain Malvaceae, the carcerulus splits into more than four one-seeded portions, while in certain Geraniaceae, it forms only three.

35. **Carpel:** a sporophyll, i.e. a leaf producing spores and a fundamental unit of the pistil. The pistil may consist of one or more carpels, being described as monocarpellary, dicarpellary, tricarpellary or polycarpellary.
36. **Caryopsis:** achenial, dry, indehiscent fruit, containing one seed in which the pericarp is fused with the testa and forms a single indivisible covering of the seed. The caryopsis is the typical fruit of all cereals.
- **Cork Cambium:** see *Phellogen*.
37. **Corm:** a rounded, swollen, short underground stem full of reserve food which facilitates perennation. It is a solid structure covered with scale leaves. The buds usually appear at the top of the corm.
38. **Corolla:** the second accessory part of the flower, consisting of petals, usually coloured and showy.
39. **Cotyledon:** embryonic leaf: the cotyledons store food reserves or digest and eventually absorb the food stored in the endosperm. In epigeal germination the cotyledons are raised above the ground and function as foliage leaves (i.e. photosynthesis occurs) after the reserve food has been utilized. Alternatively, in hypogea germination, the cotyledons remain underground.

40. Cremocarp: the schizocarpic fruit of the Umbelliferae. Its ovary consists of two one-seeded carpels which, when ripe, separate from each other by the splitting of the stylopod with carpophore. The indehiscent single-seeded carpels are known as mericarps. A well known example of a cremocarp is caraway.

41. Cymose Inflorescence: is one which shows sympodial branching. Its main axis ends in a flower.

— **Dioecious:** describes plants in which unisexual flowers (pistillate or staminate) are borne on different plants (see *Monoecious*).

42. Drupe: a fleshy fruit with a stone. The pericarp can be distinguished in three layers, the epicarp forming the skin of the fruit, the mesocarp producing the flesh and the endocarp, which is transformed into the stone, a woody encasement of the seed.

— **Embryo:** normally develops from a fertilized egg cell and consists of a radicle, hypocotyl, epicotyl and cotyledons (q.v.).

— **Endocarp:** the innermost layer of the pericarp, forming the stone in a drupeaceous fruit (see *Drupe*).

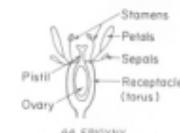

43. Endosperm: food reserve tissue enclosing the embryo and developed from the fertilized fusion nucleus, the triploid endosperm nucleus. Although the endosperm is formed in every seed, in some it disappears before the seeds are developed. Such seeds are called non-endospermous (exalbuminous), e.g. French bean and sunflower seeds. Seeds in which the endosperm is retained are called endospermous (albuminous), e.g. castor oil seeds and cereal grains.

GLOSSARY

— **Epicarp:** the outermost layer of the pericarp which is represented by the skin of the fruit (see *Berry* and *Drupe*).

— **Epicotyl:** the stem above the cotyledons (see *Hypocotyl*).

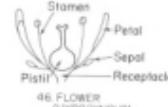

44. Epigyny: describes the condition when the carpels are embedded in the receptacle (torus) to form an inferior gynoecium. The flower is said to be epigynous e.g. apple (see *Hypogyny*).

45. Etaerio: an aggregation of fruits, e.g. of druplets in blackberry or raspberry.

46. Flower: an organ of sexual reproduction often consisting of four parts, two accessory (sepals and petals) and two essential (stamens and pistils).

47. Follicle: a dry dehiscent fruit of a single free carpel opening along only one suture.

48. Fruit: a true fruit is strictly the structure which develops only from the seed-box wall enclosing the seeds. However, there are many so-called fruits which are formed partly from other components.

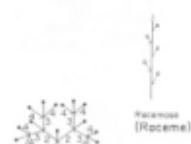

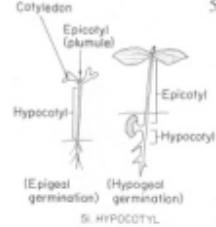

49. Funicle: the stalk by which the seed (ovule) is attached to the placenta, a swelling in the seed-box wall.

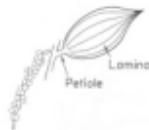

— **Gynoecium:** collective name for the pistil or pistils in the flower. Polycarpellary gynoecia are of two kinds, either the carpels are united into one pistil (syncarpous gynoecium, e.g., poppy) or each carpel forms one pistil (apocarpous gynoecium, e.g. strawberry).

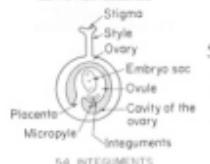

50. HESPERIDIUM

52. INFLORESCENCE

53. INFRUCTESCENCE

54. INTEGUMENTS

PLANTS CONSUMED BY MAN

50. **Hesperidium:** the berry-like citrus fruit. It has a rind which represents the epicarp and mesocarp and which can be separated easily from the juicy part, formed of endocarpous sacs filled with juice, occupying the cavities of the carpels.

51. **Hypocotyl:** the part of the stem bearing the cotyledons. If the cotyledons are brought above ground, the hypocotyl appears as the aerial part of the plant (epigeal germination) but if the germination is hypogeal, both the cotyledons and the hypocotyl remain buried in the soil.

— **Hypogynous:** when the sepals, petals and stamens are inserted below the seed-box, the gynaecium is said to be superior and the flower hypogynous (see *Epigyny*, also *Flower*).

52. **Inflorescence:** a group of flowers, usually set apart from the foliage leaves. The inflorescence is classified according to its mode of branching, which may be racemose (indefinite and not terminating in a flower) or cymose (definite, terminating in a flower).

53. **Infructescence:** the inflorescence converted into fruits.

54. **Integument:** the ovule is covered by one or two integuments which develop into the seed-coat.

GLOSSARY

55. **Involucre:** the collection of bracts which for example completely encloses the young inflorescences of the capitulum.

— **Lamina:** a leaf-blade (for illustration, see *Infructescence*).

— **Latex:** milky fluid exuded from the plant when injured.

56. **Legume:** dry dehiscent monocarpellary fruit which opens along both sutures (ventral and dorsal).

57. **Lomentum:** a legume or siliqua constricted between the seeds. It breaks when ripe, into indehiscent one-seeded compartments.

— **Mesocarp:** the middle layer of the pericarp, developing into flesh in the drupes (see *Drupe*).

— **Micropyle:** the pore left by the integument for fertilization. It persists in the ripe seed in the testa.

— **Monoecious:** refers to plants bearing unisexual flowers, both staminate and pistillate on the same individual.

— **Nectar:** sugary secretion of the nectaries, sucked by pollinating insects.

58. **Nectary:** organ that secretes sugar-containing nectar. It is either a special structure on the receptacle or a glandular surface of the various floral parts.

— **Nucellus:** the tissue of the ovule excluding the megasporangium and integuments.

59. **Nut:** a dry indehiscent one-seed fruit with a woody pericarp.

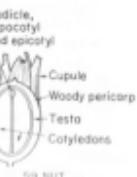

55. INVOLUCRE

56. LEGUME POD

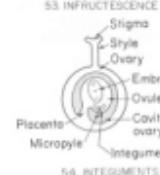

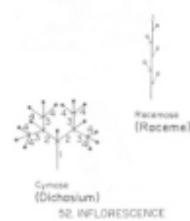

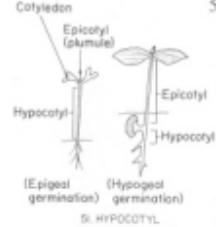

57. LOEMENTUM

59. NUT

50. HESPERIDIUM

50. **Hesperidium:** the berry-like citrus fruit. It has a rind which represents the epicarp and mesocarp and which can be separated easily from the juicy part, formed of endocarpous sacs filled with juice, occupying the cavities of the carpels.

51. **Hypocotyl:** the part of the stem bearing the cotyledons. If the cotyledons are brought above ground, the hypocotyl appears as the aerial part of the plant (epigeal germination) but if the germination is hypogeal, both the cotyledons and the hypocotyl remain buried in the soil.

— **Hypogynous:** when the sepals, petals and stamens are inserted below the seed-box, the gynaecium is said to be superior and the flower hypogynous (see *Epigyny*, also *Flower*).

52. **Inflorescence:** a group of flowers, usually set apart from the foliage leaves. The inflorescence is classified according to its mode of branching, which may be racemose (indefinite and not terminating in a flower) or cymose (definite, terminating in a flower).

53. **Infructescence:** the inflorescence converted into fruits.

54. **Integument:** the ovule is covered by one or two integuments which develop into the seed-coat.

55. **Involucre:** the collection of bracts which for example completely encloses the young inflorescences of the capitulum.

— **Lamina:** a leaf-blade (for illustration, see *Infructescence*).

— **Latex:** milky fluid exuded from the plant when injured.

56. **Legume:** dry dehiscent monocarpellary fruit which opens along both sutures (ventral and dorsal).

57. **Lomentum:** a legume or siliqua constricted between the seeds. It breaks when ripe, into indehiscent one-seeded compartments.

— **Mesocarp:** the middle layer of the pericarp, developing into flesh in the drupes (see *Drupe*).

— **Micropyle:** the pore left by the integument for fertilization. It persists in the ripe seed in the testa.

— **monoecious:** refers to plants bearing unisexual flowers, both staminate and pistillate on the same individual.

— **Nectar:** sugary secretion of the nectaries, sucked by pollinating insects.

58. **Nectary:** organ that secretes sugar-containing nectar. It is either a special structure on the receptacle or a glandular surface of the various floral parts.

— **Nucellus:** the tissue of the ovule excluding the megasporangium and integuments.

59. **Nut:** a dry indehiscent one-seed fruit with a woody pericarp.

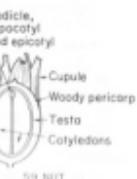

55. INVOLUCRE

56. LEGUME POD

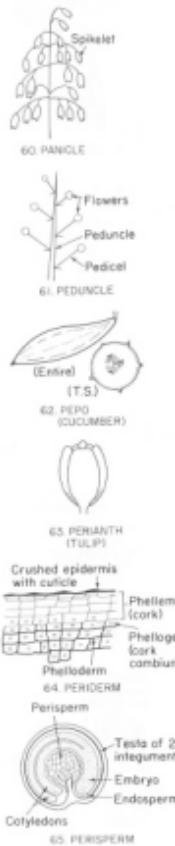

57. LOIMENTUM

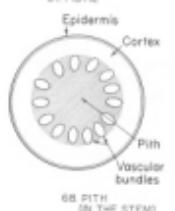

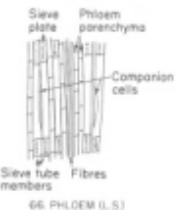

58. NECTARIES
Forming a disc
between the
stamens and
ovary

59. NUT

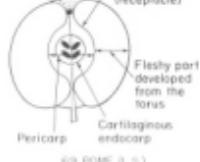

- **Ovary:** or seed-box wall. It is the basal portion of the pistil covering the ovules.
- **Ovule:** an outgrowth of the carpel (sporophyll), attached by a funicle. The ovule contains the embryo sac which develops from the megasporangium. The ovum or oosphere is in the embryo sac and when fertilized, the embryo develops. The endosperm is formed from the fertilized fusion nucleus, while the seed develops from the entire ovule (see *Funicle*).
- 60. **Panicle:** a raceme of spikelets.
- **Pedicel:** the stalk of an individual flower in an inflorescence (see *Peduncle*).
- 61. **Peduncle:** the main and also eventually the secondary axis of the inflorescence.
- 62. **Pepo:** the berry-like fruit of the Cucurbitaceae. The rind is derived from the receptacle and cannot be separated, peeled from the flesh. The fruit of a *Cucurbita* (e.g. a cucumber) has an inferior gynoecium.
- 63. **Perianth:** the calyx (sepals) together with the corolla (petals). In many flowers, especially monocotyledons, the sepals cannot be distinguished from the petals and the term perianth is then applied.
- **Pericarp:** the whole structure developed from the seed-box. It can be divided into epidermis, mesocarp and endocarp (see *Nut*).
- 64. **Periderm:** the cork (phellem) and phelloidem, together with the cork cambium (phellogen).
- 65. **Perisperm:** the reserve food materials stored in the seed and located in the tissue developed from the nucellus (see *Nucellus*).

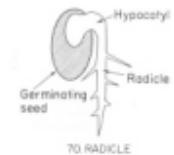

- **Petals:** leaf-like structures forming the corolla, usually coloured and showy (see *Corolla*).
- **Petiole:** stalk of the leaf (for illustration, see *Infructescence*).
- **Phellem:** cork produced by the cork cambium (see *Periderm*).
- **Phellogen:** cork cambium; the meristematic (dividing) tissue, cutting cork outwards and phellogen inwards (see *Periderm*).
- 66. **Phloem:** the food-conducting tissue of the stele, consisting mainly of sieve tubes, companion cells and fibres.
- 67. **Pistil:** is a flask-shaped structure with a large hollow base known as the ovary or seed-box, from which projects a column or style, ending in a tip or stigma specially adapted for pollination.
- 68. **Pith:** the central part of the stem or root enclosed in a hollow vascular cylinder. It is formed of parenchymatous (i.e. the least differentiated) tissue and functions as a food-storing structure.
- **Placenta:** cushion-like swelling of the carpel, where the funicle, the stalk of the ovule arises.
- **Plumule:** synonym for epicotyl (see *Epicotyl*).
- 69. **Pome:** a berry-like fruit of some Rosaceae, formed mainly from the receptacle.

Boundary between the pericarp and torus (receptacle)

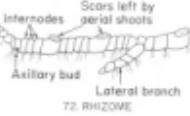

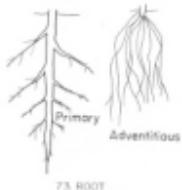

70. RADICLE

PI. RAPHE

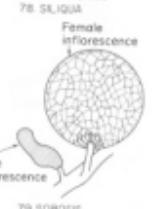

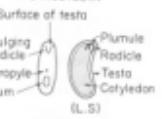

72. RHIZOME

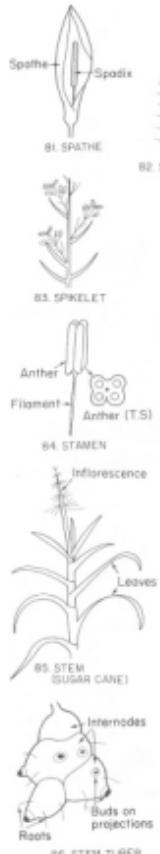

73. ROOT

- **Raceme:** a typical raceme consists of a peduncle and pedicellate flowers (see *Peduncle*).
- **Racemose Inflorescence:** shows monopodial branching. Raceme, corymb, spike, spadix, umbel and capitulum are different kinds of racemose inflorescences (see separate headings).
- 70. **Radicle:** the embryonic root, appearing as a continuation of the hypocotyl.
- 71. **Raphe:** the portion of the funicle fused with the ovule.
- **Receptacle:** the tip of the pedicel into which the floral parts are inserted. Another name for the receptacle is the torus.
- **Resins:** the oxidation products of various essential oils. Resins, which are insoluble in water and resemble heavy glue, are exuded when the plants are injured.
- 72. **Rhizome:** an underground stem normally growing horizontally below the surface. As a stem, it must always bear leaves and buds. The leaves may be large foliage leaves rising above the ground, or more frequently, scale leaves, i.e. membranous degenerated scales with buds in their axils.
- 73. **Root:** generally an organ that absorbs water with mineral salts from the soil, conducts water, mineral salts and food, anchors the plant and stores food. Two types of root are distinguished, primary roots and adventitious roots. The primary root system is derived from the radicle, i.e. from the embryonic root, and consists of the taproot and its branches. The adventitious roots are derived from structures other than the radicle, mainly from the base of the stem.

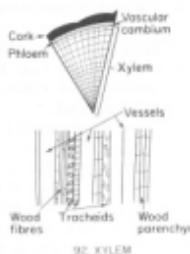

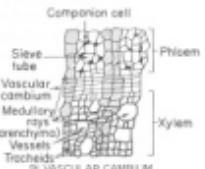

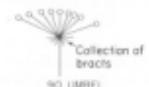

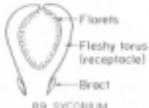

- 74. **Root, Swollen Tap-**: the main root developed from the radicle may be swollen and fleshy at its base due to the accumulation of food reserves. The hypocotyl is normally incorporated in the swelling.
- 75. **Root Tubers:** Tubers occur on adventitious roots. They have a reproductive function, being associated with buds capable of growing into a new plant.
- 76. **Sarcotesta:** the gelatinous covering of the seed developed from the outer integument.
- **Scutellum:** is another name for the single cotyledon in monocotyledonous plants, being so named because early botanists failed to recognize this structure as a cotyledon.
- 77. **Seed:** the structure enclosed by the testa and containing the embryo, together with (eventually) the endosperm and also the perisperm.
- **Sepal:** leaf-like, usually green structure. Sepals together form the outermost floral whorl, the calyx (see *Calyx*).
- 78. **Siliqua:** elongated cylindrical fruit opening along the opposite sutures, but leaving behind the false septum bearing the seeds. The placenta is also left behind, forming the replum, the framework of the false septum, rendering the fruit bilocular.
- 79. **Sorosis:** a composite fruit which is formed of a spike in which the axis and fleshy flowers fuse together, e.g. as in the breadfruit.
- 80. **Spadix:** a racemose inflorescence similar to the spike, but distinguished from it by the swollen fleshy peduncle to which the sessile flowers adhere.

81. **Spathe:** a bract enveloping the whole spadix (a massive fleshy spike) as in the Arum, or a single flower as in the daffodil.
82. **Spike:** a racemose inflorescence in which the pedicels are suppressed and thus the flowers are sessile, appearing straight on the peduncle.
83. **Spikelet:** the unit of the inflorescences in grasses. The inflorescence of a grass consists not of individual flowers but of groups of flowers called spikelets. The number of flowers in the spikelets varies. In some cases, only one flower is perfectly formed, the other being degenerate.
84. **Stamen:** the male organ of the flower. Collectively, the stamens in a flower form the androecium. Each stamen consists of a stalk or filament and an anther, in which are produced the pollen grains.
85. **Stem:** an organ displaying leaves and also conducting water with mineral salts and food. If the stem is herbaceous, it performs a photosynthetic function as well. The places where the leaves arise from the stem are called nodes, while the parts of the stem between two successive nodes are called internodes. The stem thus consists mainly of internodes (not present in roots), and bears leaves as well as buds.
86. **Stem Tuber:** organ of vegetative propagation. They are swollen ends of underground stems and bear buds in the axils of scale-like leaves. The best known example is the potato tuber.
- **Stigma and Style:** the parts of the pistil forming the free end of the seed-box. The style is a column with the sticky stigma at its tip. The stigma is a surface specially adapted to retain the pollen grain at pollination (see *Pistil*).

87. **Stolon:** a runner, a slender stem that runs along the surface of the ground, producing at intervals, buds which are able to reproduce the plant. These occur in strawberries, for example.
88. **Strobilus:** dry composite fruit of hop developing from an axis bearing numerous membranous scales. In the axil of each scale are two pistillate flowers. The fruit is called a strobilus because of its cone-like appearance.
- **Style:** see *Stigma* and *Style*.
89. **Syconium:** a composite fleshy fruit developed from a large number of flowers enclosed in a flask-shaped receptacle. A well known example is the fig.
- **Tepal:** when the sepals are indistinguishable from the petals, the term tepal is applied to both structures (see *Perianth*).
- **Testa:** the seed coat developed from the integuments or integument (see *Seed*).
- **Torus:** another name for the receptacle.
- **Tracheid:** (see *Xylem*).
90. **Umbel:** a racemose inflorescence in which the development of the peduncle is suppressed and all the pedicels arise at the same level.
91. **Vascular Cambium:** the meristematic tissue (i.e. dividing tissue) from which the secondary xylem is cut centripetally and the secondary phloem centrifugally.
92. **Xylem:** the conductive tissue for water with mineral salts in the stele. Xylem consists mainly of water-conducting elements, i.e. the tracheids and vessels.

LIST OF PLANTS

in order of appearance in the text

Key: Cyanophyta (C); Algae (A); Fungi (F); Bacteria (B); Pteridophyta (P); Gymnospermae (G); Monocotyledoneae (M); Dicotyledoneae—all other entries.

Numbers on left indicate sequence in the text; those on right are page numbers.

	CER		
1.	Barley (M)	19	Sugar Wrack (A) 53
2.	Maize (M)	20	<i>Boletus</i> spp. (F) 57
3.	Millet, Finger (M)	24	Chanterelle (F) 58
4.	Millet, Foxtail (M)	24	Club and Coral Fungi (F) 59
5.	Millet, Japanese Barnyard (M)	25	Jew's Ear (F) 59
		30	Morel (F) 60
6.	Millet, Pearl (M)	25	Mushroom (White) (F) 61
7.	Millet, Proso (M)	25	Orange Agaric (F) 62
8.	Oat (M)	26	Os Tongue (F) 62
9.	Rice (M)	27	Padi Straw Mushroom (F) 63
10.	Rye (M)	28	Puff Ball (F) 64
11.	Sorghum (M)	29	<i>Russula</i> spp. (F) 64
12.	Wheat (M)	29	Shiitake Mushroom (F) 65
		38	Fiddlehead Fern (P) 66
		39	Artichoke, Chinese 67
		40	Artichoke, Globe 68
		41	Artichoke, Jerusalem 69
		42	Asparagus (M) 70
		43	Avocado 71
		44	Bambara Groundnut 72
		45	Bamboo (M) 74
		46	Bean, Adzuki 74
		47	Bean: Black Gram 75

23.	Nori (A)	52	Bean, Lima and Sieva 79
24.	Sea Lettuce (A)	53	Bean, Moth 81

PLANTS CONSUMED BY MAN

55.	Bean: Mung	81	101.	Pea, Pigeon	125
56.	Bean, Scarlet Runner	82	102.	Potato	126
57.	Bean, Soya	83	103.	Potato, Sweet	130
58.	Bean, Tepary	84	104.	Pumpkins and Squashes	132
59.	Bean, Yam	84	105.	Radish	135
60.	Beetroot	85	106.	Rhubarb	136
61.	Breadfruit	87	107.	Roselle	137
62.	Broccoli	89	108.	Salsify	137
63.	Brussels Sprout	90	109.	Seakale	138
64.	Cabbage	91	110.	Scolymus	138
65.	Cabbage, Chinese	92	111.	Scorzonera	138
66.	<i>Capsicum</i>	92	112.	Spinach	139
67.	Cardoon	94	113.	Swede	139
68.	Carrot	94	114.	Taro (M)	140
69.	Cassava	96	115.	Tomato	141
70.	Cauliflower	97	116.	Turnip	142
71.	Celeriac	98	117.	Water Chestnut, Chinese	
72.	Celery	99		(M)	142
73.	Chard, Swiss	100	118.	White Mustard	143
74.	Chayote	100	119.	Yam (M)	143
75.	Chervil, Turnip-rooted	102			
76.	Chicory	102			
77.	Cress, Garden	103	120.	Akee	151
78.	Cress, Water-	103	121.	Apple	152
79.	Cucumber	104	122.	Apricot	155
80.	Dandelion	105	123.	Bael	156
81.	Egg-plant	106	124.	Banana (M)	157
82.	Elder	107	125.	Barbados Cherry	159
83.	Endive	107	126.	Bilberry	160
84.	Fennel	108	127.	Blackberry	161
85.	Jack-fruit	108	128.	Carambola	163
86.	Kale and Collard	110	129.	Carob	163
87.	Kohl-rabi	110	130.	Cashew Apple	164
88.	Leek (M)	111	131.	Ceriman (M)	165
89.	Lentil	112	132.	Cherry, Sour	166
90.	Lettuce	113	133.	Cherry, Sweet	167
91.	Lotus	115	134.	Cranberry and Cowberry	167
92.	Okra	116	135.	Currant	169
93.	Olive	117	136.	Custard Apple	170
94.	Onion (M)	117	137.	Date (M)	171
95.	Parsley	119	138.	Durian	172
96.	Parsnip	120	139.	Fig	173
97.	Pea, Garden and Field	120	140.	Gooseberry	175
98.	Pea, Chick	122	141.	Grape	176
99.	Pea, Cow-	123	142.	Grapefruit	179
100.	Pea, Grass	124	143.	Guava	180

LIST OF PLANTS

144.	Huckleberry	181	187.	Sunflower	223
145.	Kumquat	181	188.	Walnut	224
146.	Litchi	182			
147.	Loganberry	182			
148.	Loquat	182	189.	Arrowroot (M)	227
149.	Mamey	183	[69.]	Cassava	228
150.	Mandarin, Tangerine, etc.	183	190.	Sago Palm (M)	229
151.	Mango	184			
152.	Mangosteen	185			
153.	Medlar	186	191.	Cocoa	231
154.	Melon	186	[179.]	Coconut	233
155.	Mulberry	188	192.	Cotton	233
156.	Nectarine	188	[2.]	Maize (M)	234
157.	Orange	189	193.	Niger Seed	235
158.	Papaya	190	194.	Oil Palm (M)	235
159.	Passion Fruit	190	195.	Palm Oil of Brazil (M)	237
160.	Peach	191	[93.]	Olive	237
161.	Pear	192	[183.]	Peanut (Groundnut)	238
162.	Persimmon	193	196.	Rape	239
163.	Pineapple (M)	194	197.	Safflower	240
164.	Plums and Prunes	195	198.	Sesame	241
165.	Pomegranate	196	199.	Shea Butter	241
166.	Quince	197	[57.]	Soya Bean	243
167.	Rambutan	197	[187.]	Sunflower	243
168.	Raspberry	198			
169.	Rose Hip	199			
170.	Sapotilla	200	[1.]	Barley (M)	246
171.	Strawberry	201	[11.]	Sorghum (M)	246
172.	Watermelon	202	200.	Sugar Beet	247
			201.	Sugar Cane (M)	248
			202.	Sugar Maple	249
173.	Pine Nut (G)	207	203.	Sugar Palms (M)	250
174.	Acorn	208	204.	Nectar Plants	251
175.	Almond	209			
176.	Beechmast	210			
177.	Brazil Nut	211	205.	Agar (A)	252
[130.]	Cashew Nut	212	206.	Algin (A)	254
178.	Chestnut	212	207.	Carrageenan (A)	256
179.	Coconut	214	208.	Furcellaran (A)	258
180.	Hazel Nut	216	209.	Larch Gum (G)	258
181.	Macadamia Nut	217	210.	Sodium Carboxymethyl-cellulose	259
182.	Oyster Nut	218			
183.	Peanut	219	[121.]	Apple (Pectin)	259

INDEX OF SCIENTIFIC AND COMMON PLANT NAMES

Asterisks mark plants of New World origin; numbers indicate pages in the text where descriptions are given.

- A**
- Absidia* spp. (Phycomycetes), 389
Acacia senegal and *drepicoloribium*—gum Arabic, 260
*Acer nigrum** and *saccharum**—sugar maple, 249
Acetosella = *Malpighia glabra**, 159–160
Acetobacter spp. (bacteria), 387
 A. aceti
 A. acetogenum
 A. curcum
 A. kuetzingianum
 A. melanogenum (reclassified as *Acetomonas*—*Am*)
 A. oxydans (*Am*)
 A. pasteurianum
 A. rancens
 A. roseum (*Am*)
 A. schuetzenbachii
 A. suboxydans (*Am*)
 A. xylinum
Achras zapota (*Manilkara achras*)*—sapotilla, chiku, 200–201
Acorn = *Quercus* spp., 208–209
 European spp.:
 Q. ilex
 Q. petraea (*sessiliflora*)
 Q. robur (*pedunculata*)
Acorus calamus = calamus, 285
Aegilops (wheat progenitors)
 speltaoides, 30
 squarrosa, 30

 Peppermint, Japanese = *M. arvensis* var. *piperascens*, 318
*Persea americana** = avocado, 71–72
*P. a. var. *dymosifolia** = small avocado, 71–72
 Persimmon = *Diospyros kaki*, 193–194
*D. virginiana**, 194
Petroselinum crispum (hortense) = parsley, 316
*P. c. var. *tuberosum** = turnip-rooted, Hamburg parsley, 119
 Pe-tsai = *Brassica pekinensis*, 92
 Peyote = *Lophophora williamsii**, 379–380
Phaseolus spp.* = beans, 74–85
P. acuminatus = moth, mat bean, 81
P. acutifolius var. *latifolius* = tepary bean, 84
- P
- P. aureus (Vigna aurea)* = mung bean, golden and green gram, 81
*P. coccineus (multiflorus)** = scarlet runner (multiflora bean), 82
*P. lunatus** = sieva bean, 79–80
*P. l. var. *macrocarpus** = butter bean, Lima bean, 79–80
*P. multiflorus** = multiflora bean (scarlet runner), 82
P. mungo = black gram, urd, woolly pyuri, 75
P. vulgaris = common, French, kidney bean, 77–78
Phoenix dactylifera = date, 171–172
Phoenix sylvestris = wild date palm, 250, 365
Phyllophora nerone (agar substitute), 263
Phyllostachys pubescens = “bamboo”, 74
 Pigeon pea = *Cajanus cajan*, 125
Pignut = *Carya glabra**, 221
 Pili nut = *Canarium luzonicum* and *ora-*
tum, 222
*Pimenta dioica** = allspice, 275–276
 Pimento (allspice) = *Pimenta dioica**, 275–276
 Pimiento = *Capsicum annuum**, 93, 287
Pimpinella anisum = anise, aniseed, 278
 Pine (nuts, kernels) = *Pinus* spp., 207–208
 Pine (resin) = *Pinus* spp., 275
 Pineapple = *Ananas comosa**, 194–195
Pinus spp. = pine, 207–208
P. cembra (Swiss stone pine), 208
P. cembroides var. *edulis*, 208
P. cembroides var. *monophylla*, 208
P. koraiensis, 208
P. pinea (Italian stone pine) = pignolias, pinocchio), 207
Piper betle = betel pepper, 373
Piper longum = long pepper, 316
Piper nigrum = black pepper, 316–317
 Pistachio = *Pistacia vera*, 222–223
Pisum sativum = pea, 120–122
P. s. var. arvense = field pea, 120
P. s. var. hortense = garden pea, 120
 Plantain = *Musa paradisiaca* var. *para-*
disca, 158

Plum = *Prunus* spp., 195–196, 364
cherry plum (*P. cerasifera*), 195
damson, mirabelle (*P. insititia*), 195
Plumcot = *Prunus domestica* × *armeniaca*
156

Polyporus militiae = blackfellow's bread,
274
Pomegranate = *Punica granatum*, 196–
197

Pomelo = *Citrus grandis*, 179

Poppy = *Papaver somniferum*, 319, 380–
381

Porphyra umbilicalis = laver, 50–51

Potato, sweet = *Ipomoea* spp.*, 130–132,
366

I. batatas, 130–132

I. aquatica, 132

I. esculenta, 132

Potato, white = *Solanum tuberosum**,
126–130, 366

Propionibacterium shermanii (cheese-
ripening bacterium), 388

Prune, see Plum

Prunus amygdalus = almond, 209–210

P. a. var. *amara* (bitter), 209

P. a. var. *dulcis* (sweet), 209

Prunus armeniaca = apricot, 155–156,
359

P. a. var. *madshurica*, 155–156

P. a. var. *sibirica*, 156

Prunus avium = sweet cherry, 167

Prunus cerasus = sour cherry, 166, 360

Prunus cerasifera = cherry plum, 195

Prunus domestica = plum, greengage, etc.,
195

P. d. var. *economica* = slovy, 195, 364

Prunus insititia = damson, mirabelle, 195

Prunus persica = peach, 191, 364

P. p. var. *nectarinia* = nectarine, 188

Psalliotus bispora = mushroom, 61–62

P. b. var. *albida*, 62

Psalliotus campestris = field mushroom,
61–62

*Psidium guajava** = guava, 180–181

Psilocybe spp.* (hallucinogenic fungi),
372

P. aztecorum, 372
P. mexicana, 372
P. zapotecarum, 372
Psophocarpus tetragonolobus = goa bean,
78

Pteridium aquilinum = bracken, 66

Puff ball = *Lycoperdon* spp., 64

giant = *Lycoperdon giganticum*, 64

Pulasan = *Nephelium mutabile*, 197

Pummelo = *Citrus grandis*, 179

Pumpkins and squashes = *Cucurbita*
spp.*, 132–135

Cucurbita pepo

C. p. var. *pepo* = pumpkins, 132–134

C. p. var. *medullosa* = summer
squashes, 132–134

C. ficifolia (Malabar gourd), 134–135

C. p. var. *melopepo* = winter squashes,
some pumpkins, 132–134

Cucurbita moschata = pumpkins, win-
ter squashes, 132–134

Cucurbita mixta = pumpkins, (winter)
squashes, 132–134

Cucurbita maxima

C. m. var. *maxima* = winter squashes,
132–134

C. m. var. *turbaniformis* = turban
squashes, 132–134

Punica granatum = pomegranate, 196–

Pyrus communis = pear, 192–193, 197

Q

Queensland nut = *Macadamia* spp., 218

Quercus spp. = oak (acorn), 208–209

Q. ilex = holm oak, 209

Q. petraea (sessilello), 209

Q. robur (pedunculate), 209

Quince = *Cydonia oblonga*, 197

Quince, Bengal = *Aegle marmelos*, 156–
157

Quinoa = *Chenopodium quinoa*, 36, 359

R

Radish = *Raphanus sativus* (raphanist-
rum), 135–136

rat-tailed = *R. caudatum*, 136

Ragi = *Ecliptina coracana*, 24

Raisin, see Grape

Rama = *Hibiscus sabdariffa* var. *sabdar-
iffa*, 137, 319

Ramaria spp. = coral fungi, 59

Rambutan = *Nephelium lappaceum*, 197

Raphanus spp. = radish, 136–137
R. sativus, 136

R. sativus (*raphanistrum*), 135

R. s. var. *esculentus*, 135

R. s. var. *longipinnatus*, 135

R. s. var. *radicula*, 135

Raphia vinifera (wine palm), 365

Rape = *Brassica napus*, 239–240

Raspberry = *Rubus idaeus*, 198

Rheum rhaboticum = rhubarb, 136–137

Rhizopus spp. (saccharifying fungi), 389

Rhodiomyia pulmata = dulse, 48–49

Rhubarb = *Rheum rhaboticum*, 136–137

Rhus coriaria = sumac, 328

Ribes spp. = currants, 169–170

*R. americanum** = American blackcur-
rant, 169

R. nigrum = blackcurrant, 169

R. rubrum, *R. petraeum* and *R. sativum*
(progenitors of red and white
currants), 169

R. sativum and vars. = whitecurrant,
169

Ribes grossularia (*usa-crispa*) = goose-
berry, 175–176

*R. hirtellum**, 176

*R. missouriense**, 176

Rice = *Oryza* spp., 27–28, 358

wild = *Zizania aquatica*, 28

Rosa spp. = rose (hip), 199–200

R. acicularis, 199

R. arvensis, 199

R. canina, 199

R. rugosa, 199

R. villosa (*mollis*), 199, 200

R. v. var. *pomifera*, 200

Roselle = *Hibiscus sabdariffa* var. *sab-
dariffa*, 137, 319

Rosemary = *Rosmarinus officinalis*, 320–
321

*Rubus alleghaniensis** = blackberry
(American), 161

*Rubus argutus** = blackberry (American),
161

Rubus caesius (*R. haitianus* × *R. argutus*)
= cloudberry, 162

*Rubus frondosus** = blackberry (Ameri-
can), 161

Rubus fruticosus = blackberry (Euro-
pean), 161

Rubus idaeus = raspberry, 198

*Rubus loganobaccus** = loganberry, 182

*Rubus occidentalis** = raspberry (Ameri-
can), 198

Rubus satyrlis = rock bramble, 162

*Rubus strigosus** = raspberry (American),
198

*Rubus ursinus** = Loganberry, 182

Russula spp. (edible gill fungi), 64

R. cyanoxantha, 64

R. vesca, 64

R. violaceipes, 64

R. virescens, 64

R. xerampelina, 64

Rutabaga = *Brassica napobrassica*, 139

Rye = *Secale cereale*, 28–29, 358

S

Saccharomyces spp. = yeast, 390–391

S. bayanus, 391

S. beticus, 391

S. carlsbergensis, 390

S. cerevisiae, 391

S. c. var. *anomalis*, 391

S. c. var. *ellipsoideus*, 391

S. c. var. *sake*, 391

S. fermentati, 391

S. fructuum, 391

S. oriformis, 391

S. pyriformis, 391

Saccharum officinarum = sugar cane,
248–249, 364

Safflower = *Carthamus tinctorius* (saffron
substitute), 322

Saffron = *Crocus sativus*, 266, 321–322

Saffron, Indian = *Curcuma longa*, 331

- Sage = *Salvia officinalis*, 322–323
 Sago palms:
Areca saccharata, 229
Caryota urens, 229
Cycas spp., 229
Metroxylon sagu, 229
M. rumphii, 229
Oreodoxa olereacea, 229
 St. John's bread = *Ceratonia siliqua*, 163–164, 261
 Salsify = *Tragopogon porrifolius*, 137
 Salsify, black = *Scorzonera hispanica*, 138
 Salsify, Spanish = *Scolymus hispanicus*, 138
*Salvia columbariae** = chia, 36
Salvia officinalis = sage, 322–323
Sambucus nigra = elder, 107
 Sanwa = *Echinochloa crusgalli* var. *frumentacea*, 25
 Sapotilla* = *Manilkara achras*, 200–201, 375 [240]
 Sarsan = *Brassica campestris* var. *sarson*,
 Sarsaparilla = *Smilax aristolochiaefolia**,
 323
*S. officinalis**, 323
*S. regelii**, 324
 Sassafras = *Sassafras albidum**., 324–325
 Satureja spp. = savory, 325–326
S. hortensis = summer savory, 325–326
S. montana = winter savory, 325–326
 Savory = *Satureja* spp., 325–326
Schizosaccharomyces bussei = yeast, 391
 Scolymus = *Scolymus hispanicus*, 138
 Scorzonera = *Scorzonera hispanica*, 138
 Seakale = *Crambe maritima*, 138
 Seakale beet = *Beta vulgaris* var. *cicla*, 100
 Sea lettuce = *Ulva lactuca*, 53
 Japanese = *Ulva pertusa*, 53
 Secale cereale = rye, 28–29, 358
 Sechium edule = chayote, choyote, 100–101
 Sesame = *Sesamum indicum*, 241, 327
 Setaria italica = foxtail millet, 24
 Shaddock = *Citrus grandis*, 179
 Shallot = *Allium ascalonicum*, 118

- Shea butter = *Butyrospermum paradoxum*
 var. *parkii* (*B. parkii*), 241–242
 Uganda = *B. paradoxum* var. *mosi-*
cum, 242
Shorea seminis var. *mariama* and var.
pinanga = Borneo tallow, 230
 Sieva bean = *Phaseolus lunatus**, 79–80
 Sikkim = *Cucumis sativa*, 104
Sinapis alba (*Brassica alba*; *B. hirta*) =
 white mustard, 313–314
 Singhara nut = *Trapa bispinosa*, 38
 Sloke = *Porphyra umbilicalis*, 50–51
 Slivy, see Zwetschken
 Sol = *Rhodomyenia palmata*, 38
Smilax spp.* = sarsaparilla, 323–324
*S. aristolochiaefolia**, 323
*S. officinalis**, 323
*S. regelii**, 324
Solanum lycopersicum (*Lycopersicum esculentum*)* = tomato, 141–142
S. l. var. *cerasiforme*, 141 (cherry
 tomato)
S. l. var. *commune*, 141 (common
 tomato)
S. l. var. *grandifolium* (large-leaved
 tomato), 141
S. l. var. *pyriforme* (pear-shaped, plum
 tomato), 141
S. l. var. *ratatum* (upright tomato), 141
Solanum melongena var. *esculentum* = egg-
 plant, 106–107
*Solanum tuberosum** = potato (white),
 126–130, 366
Sorghum vulgare = sorghum, sorgum, 29,
 246, 358
S. r. var. *caffrorum* = kaffir, 29
S. r. var. *durra* = durha, 29
S. r. var. *neriifolium* = kaoliang, 29
S. r. var. *rexbergii* = shallu, 29
 Sorgos, 246
 Sorrel = *Rumex acetosa*, 319
 Sorrel, Jamaican = *Hibiscus sabdariffa*
 var. *sabdariffa*, 137, 319
 Spearmint = *Mentha spicata*, 326
 Spinach = *Spinacia oleracea*, 139, 266
 Spinach beet = *Beta vulgaris* var. *cicla*, 139
 Spinach, Indian = *Basella alba*, 139
 Spinach, New Zealand = *Tetragonia ex-*
pansa, 139
 Squashes, see Pumpkins
Stachys affinis = Chinese artichoke, 68
Stachys sieboldii = Japanese artichoke, 68
Stachys tuberifera = Chinese artichoke,
 67–68
 Star anise = *Illicium verum*, 279–280
 Steinpilz = *Boletus edulis*, 57
Sterculia urens = gum karaya, 263–264
 Strawberry = *Fragaria* spp., 201–202
 Alpine = *F. vesca* var. *semperflorens*,
 201
Streptococcus spp. (lactic acid bacteria)
S. cremoris, 287
S. lactis, 387
S. thermophilus, 388
*Stropharia cubensis** (hallucinogenic
 fungus), 372
 Sugar apple = *Annona squamosa**, 170
 Sugar beet = *Beta vulgaris* var. *altissima*,
 247, 364
 Sugar cane = *Saccharum officinarum*,
 248–249, 364
 Sugar maple = *Acer nigrum** and *saccha-*
*rum**, 249
 Sugar wrack = *Laminaria saccharina*, 53–
 54
 Sumac, sumach = *Rhus coriaria*, 328
 Sunflower = *Helianthus annuus**, 223
 Swede = *Brassica napobrassica* (*B. rapa*
 var. *napobrassica*), 139
 Sweet basil = *Ocimum basilicum*, 281–282
 Sweet potato = *Ipomoea* spp., 130–132,
 366
 Sweet-sop = *Annona squamosa**, 170
*Syagrus coronata** = Licuri or ouricuri
 palm, 237
Syzygium aromaticum (*Eugenia caryo-*
phyllata) = clove, 295–296

T

- Tucca leontopodioides* and *pinnatifida* =
 East Indian arrowroot, 227
 Tamarind = *Tamarindus indica*, 328

- Tamarix gallica* var. *mannifera* = tam-
 risk (mann), 244
 Tapioca = *Manihot esculenta**, 96–97,
 228, 365
Taraxacum officinale = dandelion, 105–
 106
 Taro = *Colocasia antiquorum*, 140
 Tarragon = *Artemisia dracunculus*, *A.*
dracunculoides, 329
 Tea = *Camellia sinensis* var. *sinensis* and
 var. *assamica*, 351–354
 Tea-seed oil = *Camellia sasanqua*, 230
 Telabun = *Eleusine coracana*, 24
Telfairia pedata = oyster nut, 218–219
Terfezia spp. = “truffle”, 274
Tetragonia expansa = New Zealand spin-
 ach, 139
*Theobroma cacao** = cocoa, 231–233, 342
 Thyme = *Thymus vulgaris*, 330–331
 French (or Spanish) = *T. zygis*, 331
Tilia cordata = linden (teu substitute),
 355
Tirmania spp. = “truffle”, 274
 Tobacco = *Nicotiana tabacum** and *nus-*
ticana, 381–384
 wild, *N. paniculata** and *wundata*, 383
 Toddy palm = *Caryota urens*, 250
 Tomato = *Solanum lycopersicum**, 141–
 142
 Tonka bean = *Dipteryx odorata**, 282–
 283
 Tragacanth = *Astragalus gummifer*, 264
Tragopogon porrifolius = salsify, 137
Trapa bicornuta = bull's head, 38
Trapa bispinosa = singhara nut, 38
Trapa natans = water chestnut, 37–38
Trigonella foenum-graecum = fenugreek,
 300
Triticum spp. = wheat, 29–33, 358–359
 diploid:
T. boeticum (wild), 30
T. monococcum, 30
 tetraploid:
T. dicoccum, 30
T. durum, 30, 31
T. persicum, 30

Triticum (Contd)*T. polonicum*, 30

hexaploid:

PHYSIOLOGY OF TREE CROPS

edited by L. C. Luckwill
and C. V. Cutting

Long Ashton Research Station, University of Bristol
England

1970, xiv + 382pp., £7.00/\$18.00
0 12 199950 6

This volume is a record of the papers and discussions of the Second Long Ashton Symposium held at the University of Bristol in 1969. It provides a stimulating review and source guide to studies on the fundamental aspects of tree growth, and is the first book which co-ordinates the progress in physiological investigations in fruit trees, forestry and plantation crops. As such it will be found rewarding and informative not only by botanists and plant physiologists but also by forestry researchers, pomologists, viticulturists and specialists in many tropical tree crops.

Contents

Growth and its co-ordination in trees.

Growth, morphogenesis and reproduction:

Some aspects of morphogenesis in fruit trees. Flowering and seed production in conifers. Seed production in Scots Pine. The role of budcales in the morphogenesis and dormancy of the apple fruit bud. Xylem development in conifers.

Transport and storage phenomena:

Problems and techniques in measuring transpiration from trees. Carbohydrate storage and utilization. Movement of sugars and phosphates into the sieve elements of willow. Storage and mobilization of nitrogenous compounds in apple trees with special reference to arginine.

Environmental factors:

Mycorrhiza and nutrient uptake in forest trees. Interactions of environment and crop in the water balance of tree crops. Factors affecting pollination in fruit trees. Growth potential of Douglas Fir seedlings during dormancy. The nutrition of fruit trees.

Physiological problems of selected tree crops:

The control of growth and fruitfulness of apple trees. Some aspects of the physiology of arabica coffee - the central problems and the need for a synthesis. Some environmental factors affecting flowering and fruiting in the oil palm. The role of water in the growth of the tea crop. Light as a factor in metabolism of the tea plant (*Camellia sinensis* L.). Physiological aspects of the exploitation of rubber trees. Aspects of the physiology of grape vines.

Summing up and general discussion:

Summing up.

Contents

Wheat: Introduction. Grain quality and uses. Straw characteristics. Types of wheat. Soil types and soil pH. Climate and temperatures for growth. Rotations and disease aspects. Cultivations and managing. Seed details. Varieties. Details of drilling, time of sowing and early Spring management. Chemical weed control. Irrigation. Harvest. Drying and storage. Disposal of grain and production economics. Production economics. Appendix. References. **Barley:** Introduction. Botanical classification... **Oats:** Introduction. Botanical classification... **Rye:** Introduction. Botanical classification... **Maisel:** Introduction. Evolu-

tion and botanical classification... **Beans:** *Part 1. Home or field beans:* Winter beans. Practical considerations in pollination... *Part 2. French beans (okra):* Introduction. Soils... *Part 3. Peas:* *Part 1. Peas for harvesting dry:* Introduction. Varieties... *Part 2. Contract sowing peas for canning, quick-freezing and dehydration:* Introduction. Major production areas... *Part 3. Peas for marketing green-'peling peas':* Introduction. Production areas... **Forage legumes:** *Part 1. Lucerne:* Introduction. Early history and spread of lucerne throughout the world... *Part 2. Sainfoin:* Introduction. Botanical classification... Author index. Subject index.

Applied Botany Series, Volume 2 *Proceedings of an International Symposium held at the Glasshouse Crops Research Institute, 1971*

CROP PROCESSES IN CONTROLLED ENVIRONMENTS

edited by A. R. Rees, K. E. Cockshull, D. W. Hand and R. G. Hurd

Glasshouse Crops Research Institute, Littlehampton, Sussex, England

1972, xiv + 392pp., £6.50/\$19.50

0.12.585440.4

Contents

Introductions: Controlled environments. Control of crop processes. **Controlled environments:** Phytotron: past achievements and future needs. Future trends in structures for protected cropping. Principles and progress in environmental control systems. Analysis of the microclimate in the glasshouse. A prototype, airtight, daylit, controlled environment cabinet and the rationale of its specification. **Environment-crop relations:** Introduction: some partisan remarks on the virtues of field experiments and physical analogues. Transport of nutrients from soil to crops. Responses of the barley crop to soil water stress. Gas exchange of field crops. Micro-environment, carbon dioxide exchange and growth in grass swards. The relationship between crop physiology and analytical plant physiology. Crop

processes and physics. **Environment-Plant relations:** Environment-plant relations: introduction. Net assimilation of plants as influenced by light and carbon dioxide. The response of the potato plant and tuber to temperature. Photoperiodic control of flowering in the chrysanthemum. Hormonal mediation of plant responses to the environment. The control of the rate and direction of phloem transport. **Internal control mechanisms:** Internal control mechanisms: introduction. Biochemical limitations to photosynthetic rates. The relationship between photosynthesis and respiration. Respiration and growth. Physiological and biochemical responses to wilting and other stress conditions. Conclusion: Some further aspects of control of crop processes. Author index. Subject index.
